Discussion and debate:
Use of topical antibiotics with intravitreal injections

Professor Jean-François Korobelnik
Professor Anat Loewenstein
Session aims

- To debate and discuss evidence ‘for’ and ‘against’ the use of topical antibiotics with intravitreal injections
- To provide a summary of the Vision Academy’s Viewpoint on the use of topical antibiotics with intravitreal injections
  - The Viewpoint can be found in your symposium pack
Debate:
Topical antibiotics should not be used alongside intravitreal injections

Professor Jean-François Korobelnik
University Hospital of Bordeaux,
France
Post-injection antibiotics have no effect on the rate of endophthalmitis

- Large studies have shown that the use of post-injection antibiotics does not reduce the incidence of endophthalmitis\(^1\)\(^–\)\(^4\)

- A similar outcome was also reported in one of the largest (316,576 injections), retrospective, nationwide, studies conducted in France\(^5\)

![Percentage of patients developing endophthalmitis after intravitreal injection](image)

- Storey et al.*,1
  - N=172,096\(\text{\textsuperscript{\#}}\)
  - 0.027

- Cheung et al.\(^1\)\(^–\)\(^2\)
  - N=15,895\(\text{\textsuperscript{\#}}\)
  - 0.038

- Bhavsar et al.\(^1\)\(^–\)\(^3\)
  - N=8,027\(\text{\textsuperscript{\#}}\)
  - 0.03

- Bhatt et al.\(^4\)
  - N=4,767\(\text{\textsuperscript{\#}}\)
  - 0.2

\(\text{\textsuperscript{\#}}\)For the Post-Injection Endophthalmitis Study Team. \(^1\)8,259 patients were given antibiotics for 5 days after injection; 2,370 patients received antibiotics immediately after injection.

\(\text{\textsuperscript{\#}}\)For the Diabetic Retinopathy Clinical Research Network. \(^1\)Injections.

Pre-injection antibiotics are not associated with lower bacterial loads at the injection site*

- The use of topical antibiotics (combined with povidone-iodine) before cataract surgery has been shown to result in reduced colony counts\(^1\)

- This benefit does not appear to translate to the use of topical antibiotics administered before an intravitreal injection

- **There is no additional benefit of pre-injection antibiotic use** when combined with povidone-iodine
  - Povidone-iodine reduces the number of bacterial colonies by 91%\(^3\)
  - Povidone-iodine lowers the risk of endophthalmitis to 0.06% (vs. 0.24%)\(^4\)

---

*When given in addition to povidone-iodine.

Use of antibiotics can interfere with models of care

- For patients on a PRN regimen with monthly monitoring, a requirement for pre-injection antibiotics would mean that intravitreal injections could not take place during the monitoring visit\(^1\)
  - Increased burden of appointments for patients and clinics
- Post-injection antibiotics have been estimated to increase the financial burden to the US healthcare system by an additional $64 million per year\(^2\)

**Burden on the patient**
Additional clinic visits may affect adherence to treatment

**Burden on clinic capacity**
Increased clinic visits require resources and clinician time

**Burden on the healthcare system**
Increased costs of delivering intravitreal therapy

---

Use of topical antibiotics increases antibiotic resistance

Percentage of patients with ocular colonies resistant to fluoroquinolones

![Bar chart showing percentage of patients with ocular colonies resistant to fluoroquinolones, before and after treatment.](chart)

- Prior to antibiotic treatment (n=22)
  - 25 patients: 87.5% resistant
  - Use of topical antibiotics increases antibiotic resistance

- After antibiotic treatment (n=48)
  - 25 patients: 85% resistant
  - Post-injection fluoroquinolone

Use of povidone-iodine alone with intravitreal injections does NOT lead to bacterial resistance

Percentage of conjunctival bacterial isolates resistant to fluoroquinolones, before and after 3 intraocular injections with post-injection antibiotics

![Bar chart showing percentage of conjunctival bacterial isolates resistant to fluoroquinolones.](chart)

- Prior to antibiotic treatment (n=23)
  - Ofloxacin: 57%
  - Levofloxacin: 52%
  - Gatifloxacin: 39%
  - Moxifloxacin: 34%

- After antibiotic treatment (n=48)
  - Ofloxacin: 85%
  - Levofloxacin: 85%
  - Gatifloxacin: 67%
  - Moxifloxacin: 77%

Lack of antibiotic penetration into the vitreous

- A prospective randomized study demonstrated that topical antibiotic administration leads to effective levels in the aqueous but not in the vitreous.
- The concentrations in the vitreous did not exceed the MIC$_{90}$ for the most common bacterial pathogens causing acute postoperative endophthalmitis.

<table>

*4 doses per day for three days prior to surgery (patient administered; 100% patient compliance); †1 drop every 15 minutes for a total of 3 doses administered 1 hour prior to surgery. MIC$_{90}$, minimum inhibitory concentration for 90% of isolates; SD, standard deviation. Costello P et al. Retina 2006; 26 (2): 191–195.
Debate:
Is there a case FOR topical antibiotics with intravitreal injections?

Professor Anat Loewenstein
Tel Aviv Sourasky Medical Center,
Israel
Risk of endophthalmitis with intravitreal injections

- Endophthalmitis is an uncommon, potentially devastating, complication of intravitreal injection\(^1\)
  - Occurrence ranges from 1 in 1,000 to 1 in 5,000 injections\(^2\)
  - Despite appropriate prompt therapy, visual outcomes are often poor\(^3\)
- Risk reduction strategies for prevention of endophthalmitis are particularly important for improving overall patient outcomes\(^3\)

Precautions for endophthalmitis prevention

**General consensus on:**
- Meticulous preparation
  - Avoidance of needle contact with eyelashes
  - Eyelid speculum
  - Drapes
  - Careful attention to aseptic technique
  - Povidone-iodine use
    - On ocular surface, in conjunctival cul-de-sac

**Lack of consensus on:**
- Use of sterile gloves
- Movement of conjunctiva over injection site
- **Use of pre-/post-injection antibiotics**
2014 ASRS PAT survey:
Percentage of physicians using topical antibiotics with intravitreal injections*

*Total percentage of physicians who prescribe topical antibiotics only in selected patients, or at any stage of the intravitreal injection process.

ASRS, American Society of Retina Specialists; PAT, Preferences and Trends.

Regional considerations

Possible reasons for regional variations:

- Perceived as ‘standard of care’ in some regions
- Personal preference
- Medico-legal considerations
- Mandated by label in some regions, e.g. Japan
- Resources and conditions vary between countries

Intravitreal injection technique and monitoring: Updated guidelines of an expert panel

- The dramatic increase in the number of IVT injections has been accompanied by a comparable increase in evidence surrounding IVT practice patterns and techniques.
- An expert panel of ophthalmologists performed a review of the literature regarding intravitreal injections and concluded that:
Intravitreal injection technique and monitoring: Updated guidelines of an expert panel

- The dramatic increase in the number of IVT injections has been accompanied by a comparable increase in evidence surrounding IVT practice patterns and techniques.
- An expert panel of ophthalmologists performed a review of the literature regarding intravitreal injections and concluded that:
  - There was a lack of evidence to support the routine use of pre-, peri-, and post-injection antibiotics to reduce the risk of endophthalmitis.
  - There was a lack of evidence to support the role of aerosolized droplets containing oral contaminants from the patient and/or providers as a potential source of infection.
  - The panel emphasized the continued importance of applying povidone–iodine and avoiding eyelid contact with the intended injection site and needle.

IVT, intravitreal.

What is the Vision Academy’s position?
Vision Academy Viewpoint:
Use of topical antibiotics with intravitreal injections

Based on an extensive literature search, the Vision Academy does not recommend the use of topical antibiotics alongside intravitreal injections.

There is no evidence for prevention of infection\(^1\)

There is no evidence for reduction of infection-related morbidity\(^2\)

Repeated use is proven to increase the occurrence of antibiotic resistance and can potentially increase virulence\(^1\)

There is an additional, unnecessary cost and burden to patients, physicians, and healthcare systems\(^1\)

---

Vision Academy Viewpoint:
Use of topical antibiotics with intravitreal injections

Topical antibiotic use prior to intravitreal injection

- Most infections result from inoculation of organisms at the time of injection
- No prospective studies demonstrating that pre-injection antibiotics reduce the risk of endophthalmitis\(^1\)

Topical antibiotic use concurrent with or after intravitreal injection

- No additional benefit of post-injection antibiotics in preventing endophthalmitis\(^2,3\)

General consensus

Variation in opinion

---

Vision Academy Viewpoint:
Use of topical antibiotics with intravitreal injections

Antibiotic resistance

- Several studies have demonstrated increasing resistance of conjunctival flora to topical antibiotics\textsuperscript{1,2}
- Resistance to fluoroquinolones, the most commonly used topical antibiotics in many regions, may have serious ramifications in other procedures, e.g. cataract surgery

Antibiotic penetration

- Topical administration leads to effective antibiotic levels in the aqueous but not in the vitreous\textsuperscript{3}

\textsuperscript{1} Merani R et al. Int J Retina Vitreous 2015; 1: 9.
Vision Academy Viewpoint:
Use of topical antibiotics with intravitreal injections

Significant regional differences

• Reasons for continued use of topical antibiotics with intravitreal injections include:
  • Personal preference
  • Peer pressure
  • Medico-legal concerns

• Changes in practice habits may be achieved through the revision of drug labels and the amendment of local and professional society guidelines
Summary

The Vision Academy **does not recommend the use of topical antibiotics** alongside intravitreal injections.

There is a **lack of evidence** supporting any benefit for topical antibiotic prophylaxis against post-injection endophthalmitis.

There is a growing body of evidence detailing **increased antibiotic resistance** in patients receiving topical antibiotics.

Product information for intravitreal medications should be updated to reflect this recommendation and to **remove barriers to clinicians wishing to change their practice**.
